this in the appropriate sections and references. Scientific data are now being produced at rates not believed possible ten years ago. A major goal in any scientific investigation should be to obtain a critical evaluation of the data generated in a set of experiments in order to extract whatever useful scientific information may be present. Very often, the large number of measurements present in the data set does not make this an easy task. The goals of this book are thus fourfold. The first is to create a useful reference on the applications of these statistical pattern recognition methods to the sciences. The majority of our discussions center around the fields of chemistry, geology, environmental sciences, physics, and the biological and medical sciences. In Chapter IV a section is devoted to each of these fields. Since the applications of pattern recognition techniques are

Managing in the public sector requires an understanding of the interaction between three distinct dimensions—administrative structures, organizational cultures, and the skills of individual managers. Public managers must produce results that citizens and their representatives expect from their government while fulfilling their constitutional responsibilities. In *Public Management: Thinking and Acting in Three Dimensions*, authors Carolyn J. Hill and Laurence E. Lynn, Jr. argue that one-size-fits-all approaches are inadequate for dealing with the distinctive challenges that public managers face. Drawing on both theory and detailed case studies of actual practice, the authors show how public management that is based on applying a three-dimensional analytic framework—structure, culture, and craft—to specific management problems is
