Climbing plants, including lianas, represent a fascinating component of the ecology of tropical forests. This book focuses on the climbing plants of West African forests. Based on original research, it presents information on the flora (including a checklist), diversity (with overviews at several levels of integration), ecology (distribution, characteristics in relation to environment, their role in forest ecosystems) and ethnobotany. Forestry aspects, such as their impact on tree growth and development, and the effects of forestry interventions on climbers are also covered.

This photographic guide to the wild flowers of Gambia is intended to be of use as a resource for those interested in the natural history of the country. It provides information on the geography, geology, climate, botanical exploration and vegetation types of Gambia, and contains colour photographs which cover a range of native and naturalized plants, with an emphasis on herbaceous species. The text is designed to be easy to understand, highlighting useful characteristics for identification, such as the general appearance of the plant, leaf shape, flower structure, flowering period and type of fruit produced. Information on typical habitat distribution and ethnobotany are also provided, and English and local names are listed. The use of botanical terminology has been minimized, although not at the expense of accuracy, and a glossary is included.
